1.1 Instructions

class `riscvmodel.insn.Instruction`

Base class for instructions

This is the abstract base class for all instruction. They are derived via their instruction type.

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters `machinecode` (*int*) – Machine code as 32-bit integer

execute (*model: riscvmodel.model.State*)

Execute this instruction

Execute the instruction on the given model

Parameters `model` – RISC-V core model

Returns nothing

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters `variant` – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionBType` (*rs1: int = None, rs2: int = None, imm: int = None*)

B-type instructions encode branches. Branches have two source registers that are compared. They then change the program counter by the immediate value.

Parameters

- **rs1** (*int*) – Source 1 for comparison
- **rs2** (*int*) – Source 2 for comparison

- **imm** (*int*) – Immediate for branch destination address calculation (13-bit, signed, 16-bit aligned)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionCBType` (*rd: int = None, imm: int = None*)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

class `riscvmodel.insn.InstructionCIType` (*rd: int = None, imm: int = None*)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionCRTType` (*rd: int = None, rs: int = None*)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionCSSType` (*rs: int = None, imm: int = None*)

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters *variant* – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionCType`

class `riscvmodel.insn.InstructionILType` (*rd: int = None, rs1: int = None, imm: int = None*)
I-type instruction specialization for stores. The produce a different assembler than the base class

Parameters

- **rd** (*int*) – Destination register
- **rs1** (*int*) – Source register 1
- **imm** – 12-bit signed immediate

class `riscvmodel.insn.InstructionISType` (*rd: int = None, rs1: int = None, shamt: int = None*)

I-Type instruction specialization for shifts by immediate. The immediate differs here (5-bit unsigned).

Parameters

- **rd** (*int*) – Destination register
- **rs1** (*int*) – Source register 1
- **imm** (*int*) – 12-bit signed immediate

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters *variant* – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionIType` (*rd: int = None, rs1: int = None, imm: int = None*)

I-type instructions are registers that use one source register and an immediate to produce a new value for the destination register.

Two specialization exist for this class: `InstructionILType` for load instructions and `InstructionISType` for instructions that shift by an immediate value.

Parameters

- **rd** (*int*) – Destination register
- **rs1** (*int*) – Source register 1
- **imm** (*int*) – 12-bit signed immediate

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters *variant* – RISC-V ISA variant

Returns nothing

class riscvmodel.insn.**InstructionJType** (*rd: int = None, imm: int = None*)
J-type instructions are used for jump and link instructions.

Parameters

- **rd** (*int*) – Destination register
- **imm** (*int*) – Immediate for the jump (21-bit, signed, 16-bit aligned)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class riscvmodel.insn.**InstructionRType** (*rd: int = None, rs1: int = None, rs2: int = None*)
R-type instructions are 3-register instructions which use two source registers and write one output register.

Parameters

- **rd** (*int*) – Destination register
- **rs1** (*int*) – Source register 1
- **rs2** (*int*) – Source register 2

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class riscvmodel.insn.**InstructionSType** (*rs1: int = None, rs2: int = None, imm: int = None*)
S-type instructions are used for stores. They don't have a destination register, but two source registers.

Parameters

- **rs1** (*int*) – Source register for base address
- **rs2** (*int*) – Source register for data
- **imm** (*int*) – Offset of store, for calculation of address relative to rs1

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

class `riscvmodel.insn.InstructionUType` (*rd: int = None, imm: int = None*)

U-type instructions are used for constant formation and set the upper bits of a register.

Parameters

- **rd** (*int*) – Destination register
- **imm** (*int*) – Immediate (20-bit, unsigned)

decode (*machinecode: int*)

Decode a machine code and configure this instruction from it.

Parameters **machinecode** (*int*) – Machine code as 32-bit integer

randomize (*variant: riscvmodel.variant.Variant*)

Randomize this instruction

This function randomizes the instance of an instruction according to the given variant.

Parameters **variant** – RISC-V ISA variant

Returns nothing

`riscvmodel.insn.get_insns` (*, *cls=None*)

Get all Instructions. This is based on all known subclasses of *cls*. If non is given, all Instructions are returned. Only such instructions are returned that can be generated, i.e., that have a mnemonic, opcode, etc. So other classes in the hierarchy are not matched.

Parameters **cls** (`Instruction`) – Base class to get list

Returns List of instruction classes

`riscvmodel.insn.get_mnenomics` ()

Get all known mnemonics

Returns List of all known mnemonics

Return type List[str]

`riscvmodel.insn.isa` (*mnemonic: str, *, opcode: int, funct3: int = None, funct7: int = None, funct12: int = None, variant=Variant(intregs=32, xlen=32, extensions=Extensions(M=False, A=False, F=False, D=False, Q=False, C=False)), extension=None*)

Decorator for the instructions. The decorator contains the static information for the instructions, in particular the encoding parameters and the assembler mnemonic.

Parameters

- **mnemonic** – Assembler mnemonic
- **opcode** – Opcode of this instruction
- **funct3** – 3 bit function code on bits 14 to 12 (R-, I-, S- and B-type)
- **funct7** – 7 bit function code on bits 31 to 25 (R-type)
- **funct12** – 12 bit function code on bits 31 to 20

Returns Wrapper class that overwrites the actual definition and contains static data

`riscvmodel.insn.isaC` (*mnemonic: str, opcode: int, *, funct3=None, funct4=None, funct6=None, variant=Variant(intregs=32, xlen=32, extensions=Extensions(M=False, A=False, F=False, D=False, Q=False, C=False)), extension=Extensions(M=False, A=False, F=False, D=False, Q=False, C=True)*)

Decorator for the instructions. The decorator contains the static information for the instructions, in particular the encoding parameters and the assembler mnemonic.

Parameters `mnemonic` – Assembler mnemonic

Returns Wrapper class that overwrites the actual definition and contains static data

`riscvmodel.insn.reverse_lookup` (*mnemonic: str*)

Find instruction that matches the mnemonic.

Parameters `mnemonic` – Mnemonic to match

Returns `Instruction` that matches or `None`
